2. **Instructions on how to compile and run :** There is no need to compile the program. Just make sure that the Face dataset directory containing all the test images and the script are in the same folder. To run the script , type the

following command:

python FaceRecognition.py >> output.txt

Output. Py captures the following output generated by the script:

1. PCA coefficients,
2. eigenvalues
3. classification of Images as Identical Face or Unknown Face,
4. Classification as face or Non face Image

It will create following 4 folders:

1. Eigen Faces
2. Mean Face
3. Mean Subtracted Test Faces
4. Reconstructed_test_images

Go to contents...

3. Thresholds

- For classifying the image as an identical or unknown image,

  T_1= 8.6e+7 (which is 86000000.0)

- For classifying the image as a Face or Non Face image,

  T_0 = 7e+12 (which is 7000000000000.0)

Go to contents...

4. Mean Face:

Go to contents...

5. Eigen Faces:

Go to contents..
